Mapped Elements

Example 6.21: Heat flow in an L-shaped body using Quad4 elements (p. 445)

Consider two dimensional heat flow over an L-shaped body with thermal conductivity $k = 45 \ W/m$.°C shown in Figure. The bottom is maintained at $T_0 = 110$ °C. Convection heat loss takes place on the top where the ambient air temperature is 20°C and the convection heat transfer coefficient is $h = 55 \ W/m^2$.°C. The right side is insulated. The left side is subjected to heat flux at a uniform rate of $q_L = 8000 \ W/m^2$. Heat is generated in the body at a rate of $Q = 5 \times 10^6 \ W/m^3$. Determine temperature distribution in the body.

Extract columns {5, 6}.

Multiply each column by its respective known value {110, 110}.

Move all resulting vectors to the rhs.

After adjusting for essential boundary conditions we have

$$\begin{pmatrix} 34.3 & 0.275 & -22.5 & 0 \\ 0.275 & 34.575 & -22.3625 & 0 \\ -22.5 & -22.3625 & 134.96 & 1.14038 \\ 0 & 0 & 1.14038 & 44.6846 \end{pmatrix} \begin{pmatrix} T_1 \\ T_2 \\ T_3 \\ T_4 \end{pmatrix} = \begin{pmatrix} 2311.5 \\ 2012.25 \\ 11424.8 \\ 5716.5 \end{pmatrix}$$

Solving the final system of global equations we get

Extract columns {9, 10, 11}.

Multiply each column by its respective known value {110, 110, 110}.

Move all resulting vectors to the rhs.

After adjusting for essential boundary conditions we have
